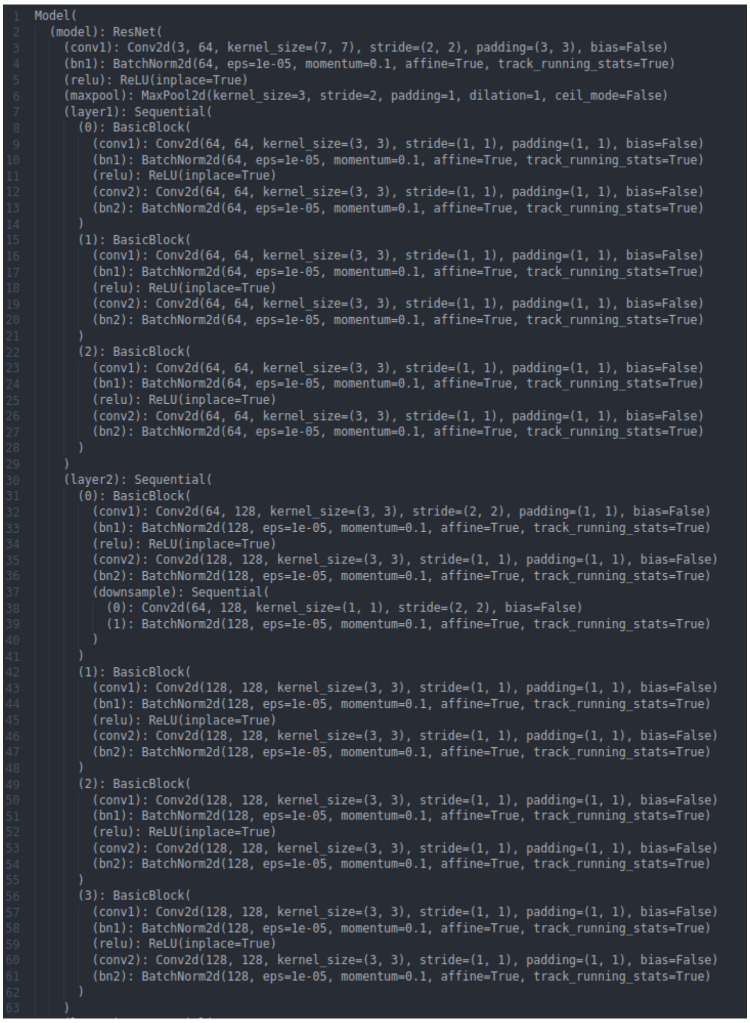
1 State all the hyperparameters you need for training and how you tune them

I don't know the meaning of "tune" hyperparameters. I just set them by following the default of sample code, make # of epochs larger, and the warmup step is my usual setting.

- Learning rate: 0.01
- Epochs: 15
- Weight decay: 0.001
- Warmup step: int(0.05 * total_step)

2 Show the structure of your best model.



```
Model(
  (model): ResNet(
    (conv1): Conv2d(3, 64, kernel_size=(7, 7), stride=(2, 2), padding=(3, 3), bias=False)

```

3 Explain the design of your model and what you’ve observed

- I just call the Resnet34 from torchvision, and train it from scratch, so I don’t have any novel design. However, I find that if I call Resnet50 or larger models, the performance would be worse.

4 Plot the learning curve during training

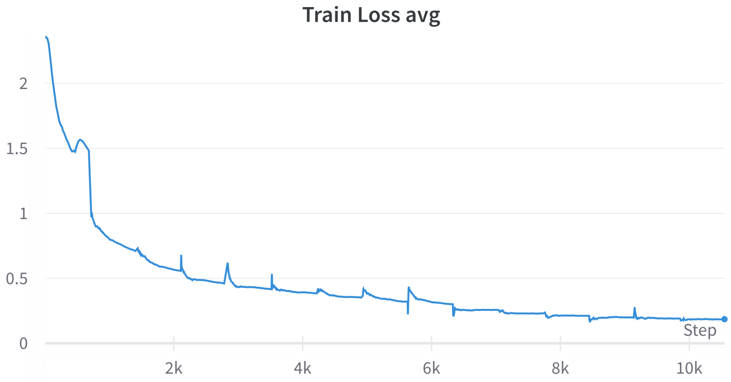

Figure 1: Learning curve of average of training loss

5 Plot the confusion matrix for validation set, and briefly explain what you’ve observed

- We can see that in Fig.2, the value of the diagonal line for each class is the highest one.
